

ENVIRONMENTAL WASTE MANAGEMENT

ENVIRONMENTAL ASPECTS & IMPACTS

A smaller quantity of waste is incinerated, the preferred option for disposing of some hazardous wastes. For example, clinical and chemical wastes require exposure to high temperatures to reduce or remove the hazards they pose. You should carry out a risk assessment for handling and disposing of fly-ash following incineration and implement suitable control measures. Precautions should be taken to prevent ash from becoming airborne and subsequently inhaled, so far as is reasonably practicable.

“The Solution Is Less Pollution”
